

Plan for the week you have.

A closing deadline changes capacity. It should change the plan before it breaks the plan.

THE IDEA, AT A GLANCE

Three levels of capacity

01 / Normal

Your full assigned schedule fits.

02 / Constrained

Fewer slots: protect the priority sessions.

03 / Survival

Sleep, regular meals and safe movement come first.

Capacity levels are a planning tool, not biological thresholds.

01 / WHY THIS WORKS

Maintenance research suggests reduced training can retain some adaptations. The required dose varies with age, training history and the outcome being maintained.

THE LIMIT OF THE EVIDENCE

A 60-hour working week is not a scientific cutoff. This framework does not guarantee maintenance or justify pushing through exhaustion.

THE LINE TO REMEMBER

A deliberately smaller week is easier to recover from than an accidental collapse.

Which week are you facing?

01 / Two reliable windows

Put those windows in your calendar now. Agree which assigned sessions take priority; leave room for recovery.

02 / Only one short window

Use an approved short option. Tell your coach early so the week can be deliberately adjusted.

03 / Unsafe fatigue or illness

Prioritise recovery. Do not drive or train through dangerous sleepiness.

03 / IN A REAL WORKING WEEK

Illustrative scenario - not a client result

A transaction closes Friday. Evenings are unpredictable, but two mornings are protected.

Useful move: Book the morning sessions and arrange a repeatable office meal before Monday.

Why: You remove two recurring decisions from the busiest part of the day.

04 / USE THIS TODAY

01 / Identify immovable work commitments.

02 / Book realistic sessions and a backup slot.

03 / Tell your coach the constraint before the week begins.

EVIDENCE / ORIGINAL SOURCES
