

Match the day to your alertness.

A poor night is information for today's choices, not an instruction to chase a recovery score.

THE IDEA, AT A GLANCE

Three decisions after poor sleep

01 / Safety

Am I alert enough to drive and train safely?

02 / Training

Can I execute the assigned work with control?

03 / Tonight

What can I protect about the next sleep opportunity?

A safety-first decision order, not a wearable readiness calculation.

01 / WHY THIS WORKS

Sleep is regulated by both sleep pressure and circadian timing. Regular sleep schedules and attention to light and caffeine can support the next sleep opportunity.

THE LIMIT OF THE EVIDENCE

One routine cannot fix insomnia, sleep apnoea or shift-work problems. Persistent symptoms need clinical assessment.

THE LINE TO REMEMBER

Protect safety today and the next sleep opportunity tonight.

How do you feel right now?

01 / Tired but functioning

Use the warm-up to assess technique and effort. Choose a coach-approved easier option if needed; avoid attempting a personal record.

02 / Sleepy enough to feel unsafe

Do not drive or perform hazardous training. Prioritise safety and arrange appropriate support.

03 / This keeps happening

Record the pattern and seek medical advice, especially with loud snoring, gasping or marked daytime sleepiness.

03 / IN A REAL WORKING WEEK

Illustrative scenario - not a client result

A late call leaves you short of sleep before a planned heavy session.

Useful move: Assess alertness first. If safe but clearly under-recovered, choose an approved easier session and protect tonight's bedtime.

Why: You reduce unnecessary risk without judging the whole programme by one night.

04 / USE THIS TODAY

01 / Use how you feel and function, not only the watch score.

02 / Avoid using late caffeine to force a normal evening.

03 / Keep the next sleep window as regular as your schedule allows.
