

Keep the pattern. Adapt the setting.

Your hotel gym is a different environment, not a reason to invent a new programme.

THE IDEA, AT A GLANCE

Travel changes the setup

01 / Check

What equipment and time are actually available?

02 / Match

Select an approved option for that setting.

03 / Return

Resume your normal plan after the trip.

A travel workflow; equipment pictures are not exercise prescriptions.

01 / WHY THIS WORKS

Resistance exercise can be effective across different prescriptions. Consistent, progressive training matters more than reproducing a familiar gym perfectly on one trip.

THE LIMIT OF THE EVIDENCE

This is a practical inference from training research. A machine, dumbbell and bodyweight exercise are not identical in loading or skill demands.

THE LINE TO REMEMBER

Take a workable version of your plan with you.

What is available on this trip?

01 / A suitable hotel gym

Use the approved hotel option. Keep movement instructions and load selection from your coach.

02 / Only a room

Check for a home or room option. If none is assigned, walking and normal daily movement can bridge the trip.

03 / Late arrival and little sleep

Do not force a hard session to keep a streak. Choose recovery and replan the next useful slot.

03 / IN A REAL WORKING WEEK

Illustrative scenario - not a client result

You land late, then have a breakfast meeting and an afternoon gap.

Useful move: Check the gym once, then use the approved afternoon option rather than sacrificing sleep for an early session.

Why: The decision fits both the trip and your recovery.

04 / USE THIS TODAY

01 / Check equipment before the trip if possible.

02 / Protect one realistic training window.

03 / Record substitutions and actual work for your coach.

EVIDENCE / ORIGINAL SOURCES

Currier et al. (2023) / Resistance training prescriptions / Systematic review & network meta-analysis

Open the linked original sources. Research findings and coaching applications are distinguished on page 1. Your assigned plan remains individual.
